What is Cooperative Learning?

Enhancing Learning—and More!—Through Cooperative Learning

Barbara J. Millis,
U. S. Air Force Academy

Some of higher education's most challenging goals include enhancing critical thinking, promoting "deep" (as opposed to superficial) learning, encouraging both self-esteem and the acceptance of others, and improving interpersonal effectiveness (with an emphasis on team skills). This paper describes cooperative learning, an instructional approach designed especially with these objectives in mind.

What is Cooperative Learning?

Cooperative learning, like collaborative learning, entails small groups working on specific tasks. It seeks to overcome some of the weaknesses of traditional small group approaches by structuring activities carefully. Cooper (1990, p. 1), in fact, regards the key to successful cooperative learning as "Structural! Structural! Structural!" Macaulay and Gonzalez (1996, p. 2) characterize it as:

The instructional use of small groups so that learners are able to work together in a manner that enhances both group and individual learning. The key to cooperative learning is the careful structuring of learning groups. There are many ways to structure such groups, but some of the key elements are the building of interdependence, the designing of interactive processes, and accountability. The building of social skills around such areas as decision-making, communication, and conflict management is also fundamental to cooperative learning.

Tang (1996, p. 116) offers an international perspective on cooperative learning, emphasizing some of its practices and effects:

Cooperative learning provides a non-threatening learning context for interaction between students. During co-operative learning, students are exposed to other perspectives and alternatives, they share and exchange ideas, criticize and provide feedback. Peer feedback can help students increase their awareness of their learning aims, and of the strategies to employ to achieve those aims. Collaboration provides "scaffolding" for mutual support and enables students to learn from each other. The function is a teaching function, although the major interaction is student-student, rather than teacher-student, as teaching is normally understood.

Regardless of the definition of cooperative learning, most experts agree that its foundation rests on several significant premises.

The Premises Underlying Cooperative Learning

The first premise underlying cooperative learning is respect for students—regardless of their ethnic, intellectual, educational, or social backgrounds—and a belief in their potential for academic success. Sapon-Shevin, Ayres, and Duncan (1994, p. 46) suggest: "Cooperative learning . . . builds upon heterogeneity and formalizes and encourages peer support and connection. . . . **All** students need to learn and work in environments where their individual strengths are recognized and individual needs are addressed. **All** students need to learn within a supportive community in order to feel safe enough to take risks."

Second, cooperative learning promotes a shared sense of community. Learning, like living, is inherently social. This approach offers students support and encouragement through systematic classroom interactions. An intellectual synergy develops, and positive relationships typically emerge.

Third, cooperative learning is predicated on the premise that learning is an active, constructive process. Myers and Jones (1993, xi) find that such learning "provides opportunities for students to **talk and listen, read, write, and reflect** as they approach course content through problem-solving exercises, informal small groups, simulations, case studies, role playing, and other activities—of all which require students to **apply** what they are learning." As a result, learning is not passively absorbed nor are facts simply added systematically to existing knowledge. Students often take new material—including conflicting viewpoints—and integrate, reinterpret, and transform it until new knowledge is forged. Thus, learning is produced, not reproduced.

The role of the instructor changes from a deliverer-of-information to a facilitator of learning. This does not mean that faculty members, who will always remain authorities in the definitive sense, abdicate their responsibility to students; rather, it means that they assume the role of "midwife professors" who "assist . . . students in giving birth to their own ideas, in making tacit knowledge explicit and elaborating on it" (Belinky, Clinchy, Goldberger, & Tarule, 1986, p. 217).

Theory and Research

Establishing a cooperative classroom entails understanding the underlying theory in order to select effective teaching approaches. Leiman (1999, p. 6) emphasizes that "a good pedagogy *selects* what is appropriate and is not wedded to a method, no matter how innovative or popular." Similarly, Palmar (1996, p. 12) reminds us that, "Our challenge is not to reduce good teaching to a particular form, model, methodology, or technique, but to understand its dynamics at the deeper levels, the underpinnings, to understand the dynamics that make connectedness a powerful force for learning in whatever forms it takes."

Using a connected, cooperative approach also reinforces the concepts of "deep learning." Four key components—totally consistent with cooperative learning practices—characterize a deep, rather than a surface approach to learning. Riem (1995, p. 4) summarizes them as follows:

Motivational context: We learn best what we feel a need to know. Intrinsic motivation remains inextricably bound to some level of choice and control. Courses that remove these take away the sense of ownership and kill one of the strongest elements in lasting learning.

Learner activity: Deep learning and "doing" travel together. Doing in itself isn't enough. Faculty must connect activity to the abstract conceptions that make sense of it, but passive mental postures lead to superficial learning.

Interaction with others: As Noel Entwistle put it in a recent email message, "the teacher is not the only source of instruction

Active Learning

Interaction with Others

"I lift, you grab. ... Was that concept just a little too complex, Carl?"

The Best answer to the question

“What is the most effective method of teaching?” is that it depends on the goal, the student, the content, and the teacher. But the next best answer is

A woman with long brown hair, wearing sunglasses and a grey cardigan over a white top, is leaning over a wooden picnic table. She is writing in a notebook with a pencil. A young woman with dark hair tied back, wearing a dark blue polo shirt, is sitting opposite her at the table, looking at the notebook. The background is a bright, sunny outdoor setting with green grass and trees.

“Students teaching other students.”

Double Entry Journal (condensed)

Critical Points	Response
<p>"Learning Styles" have been over-emphasized in the research literature.</p>	<p>I would agree! I have never been comfortable with so many different typologies. I have taken courses in the Myers-Briggs instrument, 4-MAT, etc., and I have never understood the distinctions and values. Other than the truism that we should vary our teaching methods, the learning styles information has been of little practical value for me as a faculty developer and as a teacher.</p>
<p>Researchers examined a key question, "What does it take to be good at learning?"</p>	<p>A good question!</p>
<p>Metacognition--thinking about one's thinking--appears to lie at the heart of learning, and a predisposition toward it appears to be related to the learning environment rather than to learning styles.</p>	<p>No comment . . . I'm eager to read further.</p>
<p>There are four general social orientations: academic, vocational, personal, and social.</p>	<p>Wow! As the author says, faculty resist such vocabulary. I resist more lists! How can "social" be part of the definition and part of the "stem"?</p>

The
